

Package ‘openintro’

September 1, 2012

Type Package

Title OpenIntro data sets and supplemental functions

Version 1.4

Date 2012-08-31

Author David M Diez, Christopher D Barr, and Mine Cetinkaya-Rundel

Maintainer David M Diez <david@openintro.org>

Description This package is a supplement to OpenIntro Statistics, which is a free textbook available at openintro.org (at cost paperbacks are also available for under \$10 on Amazon). The package contains data sets used in the textbook along with custom plotting functions for reproducing book figures. Note that many functions and examples include color transparency. Some plotting elements may not show up properly (or at all) in some Windows versions.

openintro-package *OpenIntro data sets and supplemental functions*

Description

This package is a supplement to OpenIntro Statistics, which is a free textbook available at openintro.org (at-cost paperbacks are also available for under \$10 on Amazon). The package contains data sets used in the textbook along with custom plotting functions for reproducing book figures. Note that many functions and examples include color transparency. Some plotting elements may not show up properly (or at all) in some Windows versions.

Details

Package: openintro
Type: Package
Version: 1.4
Date: 2012-08-31
License: GPL-2 | GPL-3
LazyLoad: yes

[boxPlot](#), [buildAxis](#), [densityPlot](#), [dotPlot](#), [edaPlot](#), [histPlot](#), [normTail](#), [cars](#), [marioKart](#), [possum](#), [run10](#), [satGPA](#), [textbooks](#)

Some colors include transparency, which means they will not be plotted in some operating systems (e.g. Windows). However, the plots may be viewed if they are written to a PDF or PNG file first. For a discussion of this topic, please see

<http://yihui.name/en/2007/09/semi-transparent-colors-in-r-color-image-as-an-example/>

Two new functions, [myPDF](#) and [myPNG](#), were created in this package and may also be used to set up nice plotting files that allow for transparency.

Description

Two utility functions. One converts state names to the state abbreviations, and the second does the opposite.

Usage

```
abbr2state(abbr)

state2abbr(state)
```

Arguments

```
state      A vector of state name, where there is a little fuzzy matching.
abbr       A vector of state abbreviation.
```

Value

Returns a vector of the same length with the corresponding state names or abbreviations.

Author(s)

David Diez

See Also

| | |
|----------|---|
| ageAtMar | <i>Age at first marriage of 5,534 US women.</i> |
|----------|---|

Description

Age at first marriage of 5,534 US women who responded to the National Survey of Family Growth (NSFG) conducted by the CDC in the 2006 and 2010 cycle.

Usage

```
data(ageAtMar)
```

Format

A data frame with 5,534 observations and 1 variable.

age Age a first marriage.

Source

National Survey of Family Growth, 2006-2010 cycle, http://www.cdc.gov/nchs/nsfg/nsfg_2006_2010_puf.htm.

```
data(ageAtMar)
histPlot(ageAtMar$age)
```

| | |
|-------------|----------------------------------|
| ballBearing | <i>Lifespan of ball bearings</i> |
|-------------|----------------------------------|

Description

A simulated data set on lifespan of ball bearings.

Usage

```
data(ballBearing)
```

Format

A data frame with 75 observations on the following variable.

lifeSpan Lifespan of ball bearings (in hours).

Source

Simulated data.

Examples

```
data(ballBearing)
par(mfrow=c(1,2))
histPlot(ballBearing$lifeSpan, col='#22558833')
qqnorm(ballBearing$lifeSpan)
```

 bdims

Body measurements of 507 physically active individuals.

Description

Body girth measurements and skeletal diameter measurements, as well as age, weight, height and gender, are given for 507 physically active individuals - 247 men and 260 women. These data can be used to provide statistics students practice in the art of data analysis. Such analyses range from simple descriptive displays to more complicated multivariate analyses such as multiple regression and discriminant analysis.

Usage

```
data(bdims)
```

Format

A data frame with 507 observations on the following 25 variables.

`bia.di` A numerical vector, respondent's biacromial diameter in centimeters.

`bi.i.di` A numerical vector, respondent's biiliac diameter (pelvic breadth) in centimeters.

`bit.di` A numerical vector, respondent's bitrochanteric diameter in centimeters.

`che.de` A numerical vector, respondent's chest depth in centimeters, measured between spine and sternum at nipple level, mid-expiration.

`che.di` A numerical vector, respondent's chest diameter in centimeters, measured at nipple level, mid-expiration.

`elb.di` A numerical vector, respondent's elbow diameter in centimeters, measured as sum of two elbows.

`wri.di` A numerical vector, respondent's wrist diameter in centimeters, measured as sum of two wrists.

`kne.di` A numerical vector, respondent's knee diameter in centimeters, measured as sum of two knees.

`ank.di` A numerical vector, respondent's ankle diameter in centimeters, measured as sum of two ankles.

`sho.gi` A numerical vector, respondent's shoulder girth in centimeters, measured over deltoid muscles.

`che.gi` A numerical vector, respondent's chest girth in centimeters, measured at nipple line in males and just above breast tissue in females, mid-expiration.

`wai.gi` A numerical vector, respondent's waist girth in centimeters, measured at the narrowest part of torso below the rib cage as average of contracted and relaxed position.

`nav.gi` A numerical vector, respondent's navel (abdominal) girth in centimeters, measured at umbilicus and iliac crest using iliac crest as a landmark.

`hip.gi` A numerical vector, respondent's hip girth in centimeters, measured at level of bitrochanteric diameter.

- thi.gi A numerical vector, respondent's thigh girth in centimeters, measured below gluteal fold as the average of right and left girths.
- bic.gi A numerical vector, respondent's bicep girth in centimeters, measured when flexed as the average of right and left girths.
- for.gi A numerical vector, respondent's forearm girth in centimeters, measured when extended, palm up as the average of right and left girths.
- kne.gi A numerical vector, respondent's knee diameter in centimeters, measured as sum of two knees.
- cal.gi A numerical vector, respondent's calf maximum girth in centimeters, measured as average of right and left girths.
- ank.gi A numerical vector, respondent's ankle minimum girth in centimeters, measured as average of right and left girths.
- wri.gi A numerical vector, respondent's wrist minimum girth in centimeters, measured as average of right and left girths.
- age A numerical vector, respondent's age in years.
- wgt A numerical vector, respondent's weight in kilograms.
- hgt A numerical vector, respondent's height in centimeters.
- sex A categorical vector, 1 if the respondent is male, 0 if female.

Examples

```
data(bdims)
histPlot(bdims$hgt)
boxPlot(bdims$hgt)
plot(bdims$wgt ~ bdims$hgt)
plot(bdims$hgt ~ bdims$sho.gi)
plot(bdims$wgt ~ bdims$hip.gi)
```

births

North Carolina births

Description

Data on a random sample of 100 births for babies in North Carolina where the mother was not a smoker and another 50 where the mother was a smoker.

Usage

```
data(births)
```

Format

A data frame with 150 observations on the following 14 variables.

fAge Father's age.

mAge Mother's age.

weeks Weeks at which the mother gave birth.

premature Indicates whether the baby was premature or not.

visits Number of hospital visits.

gained Weight gained by mother.

weight Birth weight of the baby.

sexBaby Gender of the baby.

smoke Whether or not the mother was a smoker.

Source

These birth records were

References

Birth records released by North Carolina in 2004.

Examples

```
data(births)
boxPlot(births$weight, births$smoke)
```

boxPlot

Box plot

Description

An alternative to `boxplot`. Equations are not accepted. Instead, the second argument, `fact`, is used to split the data.

Usage

```
boxPlot(x, fact=NULL, horiz=FALSE, width=2/3, lwd=1,
        lcol='black', medianLwd=2, pch=20, pchCex=1.8,
        col=rgb(0,0,0,0.25), add=FALSE, key=NULL,
        axes=TRUE, xlab='', ylab='', xlim=NULL, ylim=NULL,
        na.rm=TRUE, ...)
```

Arguments

| | |
|-----------|--|
| x | A numerical vector. |
| fact | A character or factor vector defining the grouping for side-by-side box plots. |
| horiz | If TRUE, the box plot is oriented horizontally. |
| width | The width of the boxes in the plot. Value between 0 and 1. |
| lwd | Width of lines used in box and whiskers. |
| lcol | Color of the box, median, and whiskers. |
| medianLwd | Width of the line marking the median. |
| pch | Plotting character of outliers. |
| pchCex | Size of outlier character. |
| col | Color of outliers. |
| add | If FALSE, a new plot is created. Otherwise, the boxplots are added to the current plot for values of TRUE or a numerical vector specifying the locations of the boxes. |
| key | The order in which to display the side-by-side boxplots. If locations are specified in add, then the elements of add will correspond to the elements of key. |
| axes | Whether to plot the axes. |
| xlab | Label for the x axis. |
| ylab | Label for the y axis. |
| xlim | Limits for the x axis. |
| ylim | Limits for the y axis. |
| na.rm | Indicate whether NA values should be removed. |
| ... | Additional arguments to plot. |

```

buildAxis

Axis function substitute

Description

The function `buildAxis` is built to provide more control of the number of labels on the axis. This function is still under development.

Usage

```

buildAxis(side, limits, n, nMin = 2, nMax = 10, extend = 2,
eps = 10^-12, ...)

```

Arguments

| | |
|--------|--|
| side | The side of the plot where to add the axis. |
| limits | Either lower and upper limits on the axis or a data set. |
| n | The preferred number of axis labels. |
| nMin | The minimum number of axis labels. |
| nMax | The maximum number of axis labels. |
| extend | How far the axis may extend beyond range(limits). |
| eps | The smallest increment allowed. |
| ... | Arguments passed to axis |

Details

The primary reason behind building this function was to allow a plot to be created with similar features but with different data sets. For instance, if a set of code was written for one data set and the function `axis` had been utilized with pre-specified values, the axis may not match the plot of a new set of data. The function `buildAxis` addresses this problem by allowing the number of axis labels to be specified and controlled.

The axis is built by assigning penalties to a variety of potential axis setups, ranking them based on these penalties and then selecting the axis with the best score.

Value

A vector of the axis plotted.

`cars``cars`

Description

A data frame with 54 rows and 6 columns. The columns represent the variables `type`, `price`, `mpgCity`, `driveTrain`, `passengers`, `weight` for a sample of 54 cars from 1993. This data is a subset of the `Cars93` data set from the `MASS` package.

Usage

```
data(cars)
```

Format

A data frame with 54 observations on the following 6 variables.

`type` The vehicle type with levels `large`, `midsize`, and `small`.

`price` Vehicle price (USD).

`mpgCity` Vehicle mileage in city (miles per gallon).

`driveTrain` Vehicle drive train with levels `4WD`, `front`, and `rear`.

`passengers` The vehicle passenger capacity.

`weight` Vehicle weight (lbs).

Details

These cars represent a random sample for 1993 models that were in both *Consumer Reports* and *PACE Buying Guide*. Only vehicles of type 'small', 'midsize', and 'large' were include.

Further description can be found in Lock (1993). Use the URL <http://www.amstat.org/publications/jse/v1n1/datasets.lock.html>.

ccHousing

Community college housing (simulated data)

Description

These are simulated data and intended to represent housing prices of students at a community college.

Usage

```
data(ccHousing)
```

Format

A data frame with 75 observations on the following variable.

price Monthly housing price, simulated.

Examples

```
data(ccHousing)
hist(ccHousing$price)
```

census

Random sample of 2000 U.S. Census Data

Description

A random sample of 500 observations from the 2000 U.S. Census Data.

Usage

```
data(census)
```

Format

A data frame with 500 observations on the following 8 variables.

censusYear Census Year.

stateFIPSCode Name of state.

totalFamilyIncome Total family income (in U.S. dollars).

age Age.

sex Sex with levels Female and Male.

raceGeneral Race with levels American Indian or Alaska Native, Black, Chinese, Japanese, Other Asian or Pacific Islander, Two major races, White and Other.

maritalStatus Marital status with levels Divorced, Married/spouse absent, Married/spouse present, Never married/single, Separated and Widowed.

totalPersonalIncome Total personal income (in U.S. dollars).

Source

<http://factfinder.census.gov/>

Examples

```
data(census)
str(census)
these <- census[,3] > 0      # income greater than 0
histPlot(log(census$totalFamilyIncome[these]), xlab="log(total family income)")
```

`classData`*Simulated class data*

Description

This data is simulated and is meant to represent students scores from three different lectures who were all given the same exam.

Usage

```
data(classData)
```

Format

A data frame with 164 observations on the following 2 variables.

`m1` Represents a first midterm score.

`lecture` Three classes: a, b, and c.

References

OpenIntro Statistics, Chapter 8.

Examples

```
data(classData)
anova(lm(m1 ~ lecture, classData))
```

`COL`*OpenIntro Statistics colors*

Description

These are the core colors used for the OpenIntro Statistics textbook. The blue, green, yellow, and red colors are also gray-scaled, meaning no changes are required when printing black and white copies.

Usage

```
data(COL)
```

Format

A 7-by-4 matrix of 7 colors with four fading scales: blue, green, yellow, red, black, gray, and light gray.

Source

Colors selected by OpenIntro's in-house graphic designer, [Meenal Patel](#).

References

OpenIntro Statistics, Second Edition, openintro.org.

Examples

```
data(COL)
plot(1:7, 7:1, col=COL, pch=19, cex=6, xlab="", ylab="",
     xlim=c(0.5,7.5), ylim=c(-2.5,8), axes=FALSE)
text(1:7, 7:1+0.7, paste("COL[", 1:7, "]", sep=""), cex=0.9)
points(1:7, 7:1-0.7, col=COL[,2], pch=19, cex=6)
points(1:7, 7:1-1.4, col=COL[,3], pch=19, cex=6)
points(1:7, 7:1-2.1, col=COL[,4], pch=19, cex=6)
```

contTable

Generate Contingency Tables for LaTeX

Description

Input a data frame or a table, and the LaTeX output will be returned. Options exist for row and column proportions as well as for showing work.

Usage

```
contTable(x, prop = c("none", "row", "col"),
          show = FALSE, digits = 3)
```

Arguments

| | |
|--------|--|
| x | A data frame (with two columns) or a table. |
| prop | Indicate whether row ("r", "R", "row") or column ("c", "C", "col") proportions should be used. The default is to simply print the contingency table. |
| show | If row or column proportions are specified, indicate whether work should be shown. |
| digits | The number of digits after the decimal that should be shown for row or column proportions. |

Details

The contTable function makes substantial use of the [cat](#) function.

|--------|-------------------------------|

Description

Data for 3143 counties in the United States. See the [countyComplete](#) data set for additional variables.

Usage

```
data(county)
```

Format

A data frame with 3143 observations on the following 15 variables.

name County names.

state State names.

pop2000 Population in 2000.

pop2010 Population in 2010.

fed_spend Federal spending per capita

poverty Percent of population in poverty.

homeownership Homeownership rate, 2006-2010.

multiunit Percent of housing units in multi-unit structures, 2006-2010.

income Income per capita income.

med_income Median income.

| | |
|---------|-------------------------|
| credits | <i>College credits.</i> |
|---------|-------------------------|

Description

A simulated data set of number of credits taken by college students each semester.

Usage

```
data(credits)
```

Format

A data frame with 100 observations on the following variable.

credits Number of credits.

Source

Simulated data.

Examples

```
data(credits)
histPlot(credits$credits)
```

densityPlot

*Density plot***Description**

Compute kernel density plots, written in the same structure as `boxPlot`. Histograms can be automatically added for teaching purposes.

Usage

```
densityPlot(x, fact = NULL, bw = "nrd0",
  histo = c("none", "faded", "hollow"),
  breaks = "Sturges", fading = "0E", fadingBorder = "25",
  lty = NULL, lwd = 1, col = c("black", "red", "blue"),
  key = NULL, add = FALSE, adjust = 1,
  kernel = c("gaussian", "epanechnikov", "rectangular",
    "triangular", "biweight", "cosine", "optcosine"),
  weights = NULL, n = 512, from, to, na.rm = FALSE,
  xlim = NULL, ylim = NULL, main = "", ...)
```

Arguments

| | |
|---------------------------|--|
| <code>x</code> | A numerical vector. |
| <code>fact</code> | A character or factor vector defining the grouping for data in <code>x</code> . |
| <code>bw</code> | Bandwidth. See <code>density</code> . |
| <code>histo</code> | Whether to plot a faded histogram ('faded') or hollow histogram ('hollow') in the background. By default, no histogram will be plotted. |
| <code>breaks</code> | The breaks argument for <code>histPlot</code> if <code>histo</code> is 'faded' or 'hollow'. |
| <code>fading</code> | Character value of hexadecimal, e.g. '22' or '5D', describing the amount of fading inside the rectangles of the histogram if <code>histo</code> ='faded'. |
| <code>fadingBorder</code> | Character value of hexadecimal, e.g. '22' or '5D', describing the amount of fading of the rectangle borders of the histogram if <code>histo</code> is 'faded' or 'hollow'. |
| <code>lty</code> | Numerical vector describing the line type for the density curve(s). Each element corresponds to a different level of the argument <code>fact</code> . |
| <code>lwd</code> | Numerical vector describing the line width for the density curve(s). Each element corresponds to a different level of the argument <code>fact</code> . |
| <code>col</code> | Numerical vector describing the line color for the density curve(s). Each element corresponds to a different level of the argument <code>fact</code> . |
| <code>key</code> | An argument to specify ordering of the factor levels. |
| <code>add</code> | If TRUE, the density curve is added to the plot. |
| <code>adjust</code> | Argument passed to <code>density</code> to adjust the bandwidth. |
| <code>kernel</code> | Argument passed to <code>density</code> to select the kernel used. |

| | |
|---------|--|
| weights | Argument passed to <code>density</code> to weight observations. |
| n | Argument passed to <code>density</code> to specify the detail in the density estimate. |
| from | Argument passed to <code>density</code> specifying the lowest value to include in the density estimate. |
| to | Argument passed to <code>density</code> specifying the largest value to include in the density estimate. |
| na.rm | Argument passed to <code>density</code> specifying handling of NA values. |
| xlim | x-axis limits. |
| ylim | y-axis limits. |
| main | Title for the plot. |
| ... | If <code>add=FALSE</code> , then additional arguments to <code>plot</code> . |

David Diez

See Also[histPlot](#), [dotPlot](#), [boxPlot](#)**Examples**

```

data(tips)
par(mfrow=c(2,2))
histPlot(tips$tip[tips$day == 'Tuesday'], hollow=TRUE, xlim=c(0, 30),
lty=1, main='Tips by day')
histPlot(tips$tip[tips$day == 'Friday'], hollow=TRUE, border='red',
add=TRUE, main='Tips by day')
legend('topright', col=c('black', 'red'), lty=1:2,
legend=c('Tuesday', 'Friday'))
densityPlot(tips$tip, tips$day, col=c('black', 'red'), main='Tips by day')
legend('topright', col=c('black', 'red'), lty=1:2,
legend=c('Tuesday', 'Friday'))
data(run10)
densityPlot(run10$time, histo='faded', breaks=15, main='Run time')
densityPlot(run10$time, histo='hollow', breaks=30, fadingBorder='66',
lty=1, main='Run time')

```

`dotPlot`*Dot plot*

Description

Plot observations as dots.

Usage

```
dotPlot(x, fact = NULL, vertical = FALSE, at = 1, key = NULL,
pch = 20, col = fadeColor("black", "66"), cex = 1.5,
add = FALSE, axes = TRUE, xlim = NULL, ylim = NULL, ...)
```

Arguments

| | |
|----------|--|
| x | A numerical vector. |
| fact | A character or factor vector defining the grouping for data in x. |
| vertical | If TRUE, the plot will be oriented vertically. |
| at | The vertical coordinate of the points, or the horizontal coordinate if vertical=TRUE. If fact is provided, then locations can be specified for each group. |
| key | The factor levels corresponding to at, pch, col, and cex. |
| pch | Plotting character. If fact is given, then different plotting characters can be specified for each factor level. If key is specified, the elements of pch will correspond to the elements of key. |
| col | Plotting character color. If fact is given, then different colors can be specified for each factor level. If key is specified, the elements of col will correspond to the elements of key. |
| cex | Plotting character size. If fact is given, then different character sizes can be specified for each factor level. If key is specified, the elements of cex will correspond to the elements of key. |
| add | If TRUE, then the points are added to the plot. |
| axes | If FALSE, no axes are plotted. |
| xlim | Limits for the x axis. |
| ylim | Limits for the y axis. |
| ... | Additional arguments to be passed to plot if add=FALSE or points if add=TRUE. |

```

edaPlot

Exploratory data analysis plot

Description

Explore different plotting methods using a click interface.

Usage

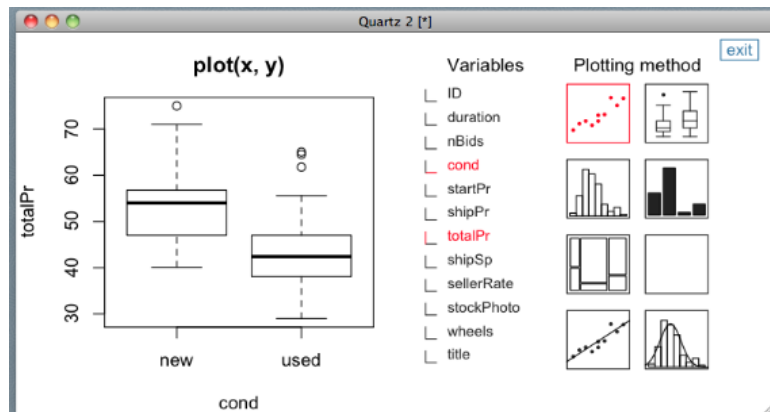

```
edaPlot(dataFrame, Col=c('#888888', '#FF0000', '#222222',
                          '#FFFFFF', '#CCCCCC', '#3377AA'))
```

Arguments

| | |
|-----------|--|
| dataFrame | A data frame. |
| Col | A vector containing six colors. The colors may be given in any form. |

Details

Below is a screen-capture image of the interface for edaPlot using the second data set in the examples below. Red is used to highlight the two active variables and plotting type.

email

Data frame representing information about a collection of emails

Description

These data represent incoming emails for the first three months of 2012 for an email account (see Source).

Usage

```
data(email)
data(email_test)
```

Format

A `email` (`email_sent`) data frame has 3921 (1252) observations on the following 21 variables.

`spam` Indicator for whether the email was spam.

`to_multiple` Indicator for whether the email was addressed to more than one recipient.

`from` Whether the message was listed as from anyone (this is usually set by default for regular outgoing email).

`cc` Indicator for whether anyone was CCed.

`sent_email` Indicator for whether the sender had been sent an email in the last 30 days.

`time` Time at which email was sent.

`image` The number of images attached.

`attach` The number of attached files.

`dollar` The number of times a dollar sign or the word “dollar” appeared in the email.

`winner` Indicates whether “winner” appeared in the email.

`inherit` The number of times “inherit” (or an extension, such as “inheritance”) appeared in the email.

`viagra` The number of times “viagra” appeared in the email.

`password` The number of times “password” appeared in the email.

`num_char` The number of characters in the email, in thousands.

`line_breaks` The number of line breaks in the email (does not count text wrapping).

`format` Indicates whether the email was written using HTML (e.g. may have included bolding or active links).

`re_subj` Whether the subject started with “Re:”, “RE:”, “re:”, or “rE:”

`exclaim_subj` Whether there was an exclamation point in the subject.

`urgent_subj` Whether the word “urgent” was in the email subject.

`exclaim_mess` The number of exclamation points in the email message.

`number` Factor variable saying whether there was no number, a small number (under 1 million), or a big number.

fadeColor

Fade colors

Description

Fade colors so they are transparent.

Usage

```
fadeColor(col, fade = "FF")
```

Arguments

| | |
|------|---|
| col | An integer, color name, or RGB hexadecimal. |
| fade | The amount to fade col. This value should be a character in hexadecimal from '00' to 'FF'. The smaller the value, the greater the fading. |

```

friday

Friday the 13th

Description

This data set addresses issues of how superstitions regarding Friday the 13th affect human behavior, and whether Friday the 13th is an unlucky day. Scanlon, et al. collected data on traffic and shopping patterns and accident frequency for Fridays the 6th and 13th between October of 1989 and November of 1992.

There are three types of observations: traffic, shopping, and accident. For traffic, the researchers obtained information from the British Department of Transport regarding the traffic flows between junctions 7 to 8 and junctions 9 to 10 of the M25 motorway. For shopping, they collected the numbers of shoppers in nine different supermarkets in southeast England. For accidents, they collected numbers of emergency admissions to hospitals due to transport accidents.

Usage

```
data(frday)
```

Format

A data frame with 61 observations and 6 variables.

`type` Type of observation, traffic, shopping, or accident.

`date` Year and month of observation.

`sixth` Counts on the 6th of the month.

`thirteenth` Counts on the 13th of the month.

`diff` Difference between the sixth and the thirteenth.

`location` Location where data is collected.

```

gifted

Analytical skills of young gifted children

Description

An investigator is interested in understanding the relationship, if any, between the analytical skills of young gifted children and the following variables: father's IQ, mother's IQ, age in month when the child first said 'mummy' or 'daddy', age in month when the child first counted to 10 successfully, average number of hours per week the child's mother or father reads to the child, average number of hours per week the child watched an educational program on TV during the past three months, average number of hours per week the child watched cartoons on TV during the past three months. The analytical skills are evaluated using a standard testing procedure, and the score on this test is used as the response variable.

Data were collected from schools in a large city on a set of thirty-six children who were identified as gifted children soon after they reached the age of four.

Usage

data(gifted)

Format

A data frame with 36 observations and 8 variables.

score Score in test of analytical skills.

fatheriq Father's IQ.

motheriq Mother's IQ.

speak Age in months when the child first said 'mummy' or 'daddy'.

count Age in months when the child first counted to 10 successfully.

read Average number of hours per week the child's mother or father reads to the child.

edutv Average number of hours per week the child watched an educational program on TV during the past three months.

cartoons Average number of hours per week the child watched cartoons on TV during the past three months.

govRace10

Election results for 2010 Governor races in the U.S.

Description

Election results for 2010 Governor races in the U.S.

Usage

```
data(govRace10)
```

Format

A data frame with 37 observations on the following 23 variables.

id Unique identifier for the race, which does not overlap with other 2010 races (see [houseRace10](#) and [senateRace10](#))

state State name

abbr State name abbreviation

name1 Name of the winning candidate

perc1 Percentage of vote for winning candidate (if more than one candidate)

party1 Party of winning candidate

votes1 Number of votes for winning candidate

name2 Name of candidate with second most votes

perc2 Percentage of vote for candidate who came in second

party2 Party of candidate with second most votes

votes2 Number of votes for candidate who came in second

name3 Name of candidate with third most votes

perc3 Percentage of vote for candidate who came in third

party3 Party of candidate with third most votes

gradesTV

Simulated data for analyzing the relationship between watching TV and grades

Description

This is a simulated data set to be used to estimate the relationship between number of hours per week students watch TV and the grade they got in a statistics class.

Usage

```
data(gradesTV)
```

Format

A data frame with 25 observations on the following 2 variables.

TV Number of hours per week students watch TV.

Grades Grades students got in a statistics class (out of 100).

Details

There are a few potential outliers in this data set. When analyzing the data one should consider how (if at all) these outliers may affect the estimates of correlation coefficient and regression parameters.

Source

Simulated data

Examples

```

data(gradesTV)
str(gradesTV)

plot(gradesTV)
makeTube(gradesTV$TV, gradesTV$Grades, 1.5, type='robust', homosk=FALSE)

lmPlot(gradesTV$TV, gradesTV$Grades, xAxis=4, xlab='time watching TV',
yR=0.2, highlight=c(1,15,20))

```

heartTr

*Heart Transplant Data***Description**

The Stanford University Heart Transplant Study was conducted to determine whether an experimental heart transplant program increased lifespan. Each patient entering the program was designated officially a heart transplant candidate, meaning that he was gravely ill and would most likely benefit from a new heart. Then the actual heart transplant occurs between a few weeks to several months depending on the availability of a donor. Very few candidates during this waiting period show improvement and get *deselected* as a heart transplant candidate, but for the purposes of this experiment those patients were kept in the data as continuing candidates.

Usage

```
data(heartTr)
```

Format

A data frame with 103 observations on the following 8 variables.

`id` ID number of the patient.

`acceptyear` Year of acceptance as a heart transplant candidate.

`age` Age of the patient at the beginning of the study.

`survived` Survival status with levels alive and dead.

`survtime` Number of days patients were alive after the date they were determined to be a candidate for a heart transplant until the termination date of the study

`prior` Whether or not the patient had prior surgery with levels yes and no.

`transplant` Transplant status with levels control (did not receive a transplant) and treatment (received a transplant).

`wait` Waiting Time for Transplant

```

helium

Helium football

Description

At the 1976 Pro Bowl, Ray Guy, a punter for the Oakland Raiders, punted a ball that hung mid-air long enough for officials to question whether the pigskin was filled with helium. The ball was found to be filled with air, but since then many have tossed around the idea that a helium-filled football would outdistance an air-filled one. Students at Ohio State University conducted an experiment to test this myth. They used two identical footballs, one air filled with air and one filled with helium. Each football was kicked 39 times and the two footballs were alternated with each kick.

Usage

```
data(helium)
```

Format

A data frame with 39 observations on the following 3 variables.

`trial` Trial number.

`air` Distance in years for air-filled football.

`helium` Distance in years for helium-filled football.

Details

Lafferty, M. B. (1993), "OSU scientists get a kick out of sports controversy," *The Columbus Dispatch* (November, 21, 1993), B7.

histPlot

Histogram or hollow histogram

Description

Create histograms and hollow histograms. This function permits easy color and appearance customization.

Usage

```
histPlot(x, col = fadeColor("black", "22"), border = "black", breaks = "default", probability = FALSE)
```

Arguments

| | |
|-------------|---|
| x | Numerical vector or a frequency table (matrix) where the first column represents the observed values and the second column the frequencies. See also <code>freqTable</code> argument. |
| col | Shading of the histogram bins. |
| border | Color of histogram bin borders. |
| breaks | A vector for the bin boundaries or an approximate number of bins. |
| probability | If FALSE, the frequency is plotted. If TRUE, then a probability density. |
| hollow | If TRUE, a hollow histogram will be created. |
| add | If TRUE, the histogram is added to the plot. |
| lty | Line type. Applies only if <code>hollow=TRUE</code> . |
| lwd | Line width. Applies only if <code>hollow=TRUE</code> . |
| freqTable | Set to TRUE if x is a frequency table. |
| right | Set to FALSE to assign values of x that fall on a bin margin to the left bin. Otherwise the ties default to the right bin. |
| axes | If FALSE, the axes are not plotted. |
| xlab | Label for the x axis. |
| ylab | Label for the y axis. |
| xlim | Limits for the x axis. |
| ylim | Limits for the y axis. |
| ... | Additional arguments to plot. If add is TRUE, these arguments are ignored. |

```

 infMortRate

Infant Mortality Rates, 2012

Description

This entry gives the number of deaths of infants under one year old in 2012 per 1,000 live births in the same year. This rate is often used as an indicator of the level of health in a country.

Usage

```
data(infMortRate)
```

Format

A data frame with 222 observations on the following 2 variables.

country Name of country.

infMortRate Infant mortality rate per 1,000 live births.

Details

The data is given in decreasing order of infant mortality rates. There are a few potential outliers.

Source

CIA World Factbook, https://www.cia.gov/library/publications/the-world-factbook/rankorder/rawdata_2091.txt.

Examples

```
data(infMortRate)
histPlot(infMortRate$infMortRate)
boxPlot(infMortRate$infMortRate)
```

| | |
|------|-----------------------------------|
| ipod | <i>Length of songs on an iPod</i> |
|------|-----------------------------------|

Description

A simulated data set on lengths of songs on an iPod.

Usage

```
data(ipod)
```

Format

A data frame with 3000 observations on the following variable.

songLength Length of song (in minutes).

Source

Simulated data.

Examples

```
data(ipod)
histPlot(ipod$songLength)
```

lmPlot *Linear regression plot with residual plot*

Description

Plot data, the linear model, and a residual plot simultaneously.

Usage

```
lmPlot(x, y, xAxis = 0, yAxis = 4, resAxis = 3, resSymm = TRUE,
wBox = TRUE, wLine = TRUE, lCol = "#00000088", lty = 1,
lwd = 1, xlab = "", ylab = "", marRes = NULL,
col = "#22558888", pch = 20, cex = 1.5, xR = 0.02,
yR = 0.1, xlim = NULL, ylim = NULL, subset = NULL,
parCustom = FALSE, myHeight = c(1, 0.45),
plots = c("both", "mainOnly", "resOnly"), highlight = NULL,
hlCol = NULL, hlCex = 1.5, hlPch = 20, na.rm=TRUE, ...)
```

Arguments

| | |
|---------|--|
| x | The x coordinates of points in the plot. |
| y | The y coordinates of points in the plot. |
| xAxis | The maximum number of x axis labels. |
| yAxis | The maximum number of y axis labels. |
| resAxis | The maximum number of y axis labels in the residual plot. |
| resSymm | Boolean determining whether the range of the residual plot should be symmetric about zero. |
| wBox | Boolean determining whether a box should be added around each plot. |
| wLine | Boolean determining whether to add a regression line to the plot. |
| lCol | The color of the regression line to be added. |
| lty | The line type of the regression line to be added. |
| lwd | The line width of the regression line to be added. |
| xlab | A label for the x axis. |
| ylab | A label for the y axis |
| marRes | Margin specified for the residuals. |
| col | Color of points. |
| pch | Plotting character. |
| cex | Plotting character size. |
| xR | Scaling the limits of the x axis. Ignored if xlim specified. |
| yR | Scaling the limits of the y axis. Ignored if ylim specified. |
| xlim | Limits for the x axis. |

| | |
|------------------------|---|
| <code>ylim</code> | Limits for the y axis. |
| <code>subset</code> | A subset of the data to be used for the linear model. |
| <code>parCustom</code> | If TRUE, then the plotting margins are not modified automatically. This value should also be TRUE if the plots are being placed within a plot of multiple panels. |
| <code>myHeight</code> | A numerical vector of length 2 representing the ratio of the primary plot to the residual plot, in height. |
| <code>plots</code> | Not currently utilized. |
| <code>highlight</code> | Numerical vector specifying particular points to highlight. |
| <code>hlCol</code> | Color of highlighted points. |
| <code>hlCex</code> | Size of highlighted points. |
| <code>hlPch</code> | Plotting characters of highlighted points. |
| <code>na.rm</code> | Remove cases with NA values. |
| <code>...</code> | Additional arguments to plot. |

```

loop

Output a message while inside a loop

Description

Output a message while inside a for loop to update the user on progress. This function is useful in tracking progress when the number of iterations is large or the procedures in each iteration take a long time.

Usage

```
loop(i, n = NULL, every = 1, extra=NULL)
```

Arguments

| | |
|-------|---------------------------------------|
| i | The index value used in the loop. |
| n | The last entry in the loop. |
| every | The number of loops between messages. |
| extra | Additional information to print. |

Author(s)

David M Diez

See Also

[myPDF](#)

Examples

```
for(i in 1:160){
  loop(i, 160, 20, paste("iter", i))
}
```

makeTube

Regression tube

Description

Produce a linear, quadratic, or nonparametric tube for regression data.

Usage

```
makeTube(x, y, Z=2, R=1, col='#00000022', border='#00000000',
  type=c('lin', 'quad', 'robust'), stDev=c('constant', 'linear', 'other'),
  length.out=99, bw='default', plotTube=TRUE, addLine=TRUE, ...)
```

Arguments

| | |
|--------|---|
| x | x coordinates. |
| y | y coordinates. |
| Z | Number of standard deviations out from the regression line to extend the tube. |
| R | Control of how far the tube extends to the left and right. |
| col | Fill color of the tube. |
| border | Border color of the tube. |
| type | The type of model fit to the data. Here 'robust' results in a nonparametric estimate. |

| | |
|------------|--|
| stDev | Choices are constant variance ('constant'), the standard deviation of the errors changes linearly ('linear'), or the standard deviation of the errors should be estimated using nonparametric methods ('other'). |
| length.out | The number of observations used to build the regression model. This argument may be increased to increase the smoothing of a quadratic or nonparametric curve. |
| bw | Bandwidth used if type='robust' or homosk=FALSE. |
| plotTube | Whether the tube should be plotted. |
| addLine | Whether the linear model should be plotted. |
| ... | Additional arguments passed to the lines function if addLine=TRUE. |

Value

| | |
|-------|---|
| X | x coordinates for the regression model. |
| Y | y coordinates for the regression model. |
| tubeX | x coordinates for the boundary of the tube. |
| tubeY | y coordinates for the boundary of the tube. |

makeTube(x, y, stDev='1', bw=0.03)

```

mammals

Sleep in Mammals

Description

This data set includes data for 39 species of mammals distributed over 13 orders. The data were used for analyzing the relationship between constitutional and ecological factors and sleeping in mammals. Two qualitatively different sleep variables (dreaming and non dreaming) were recorded. Constitutional variables such as life span, body weight, brain weight and gestation time were evaluated. Ecological variables such as severity of predation, safety of sleeping place and overall danger were inferred from field observations in the literature.

Usage

```
data(mammals)
```

Format

A data frame with 62 observations on the following 11 variables.

Species Species of mammals
BodyWt Total body weight of the mammal (in kg)
BrainWt Brain weight of the mammal (in kg)
NonDreaming Number of hours of non dreaming sleep
Dreaming Number of hours of dreaming sleep
TotalSleep Total number of hours of sleep
LifeSpan Life span (in years)

Gestation Gestation time (in days)

Predation An index of how likely the mammal is to be preyed upon. 1 = least likely to be preyed upon. 5 = most likely to be preyed upon.

Exposure An index of the how exposed the mammal is during sleep. 1 = least exposed (e.g., sleeps in a well-protected den). 5 = most exposed.

Danger An index of how much danger the mammal faces from other animals. This index is based upon Predation and Exposure. 1 = least danger from other animals. 5 = most danger from other animals.

```

marioKart

Wii Mario Kart auctions from Ebay

Description

Auction data from Ebay for the game Mario Kart for the Nintendo Wii. This data was collected in early October, 2009.

Usage

```
data(marioKart)
```

Format

A data frame with 143 observations on the following 12 variables. All prices are in US dollars.

ID Auction ID assigned by Ebay.

duration Auction length, in days.

nBids Number of bids.

cond Game condition, either new or used.

startPr Start price of the auction.

shipPr Shipping price.

totalPr Total price, which equals the auction price plus the shipping price.

shipSp Shipping speed or method.

sellerRate The seller's rating on Ebay. This is the number of positive ratings minus the number of negative ratings for the seller.

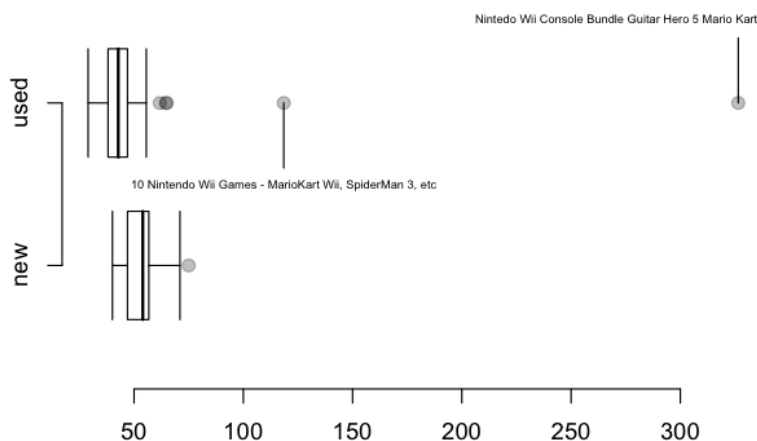

stockPhoto Whether the auction feature photo was a stock photo or not. If the picture was used in many auctions, then it was called a stock photo.

wheels Number of Wii wheels included in the auction. These are steering wheel attachments to make it seem as though you are actually driving in the game. When used with the controller, turning the wheel actually causes the character on screen to turn.

title The title of the auctions.

Details

There are several interesting features in the data. First off, note that there are two outliers in the data, as shown below. These serve as a nice example of what one should do when encountering an outlier: examine the data point and remove it only if there is a good reason. In these two cases, we can see from the auction titles that they included other items in their auctions besides the game, which justifies removing them from the data set.

This data set includes all auctions for a full week in October, 2009. Auctions were included in the data set if they satisfied a number of conditions. (1) They were included in a search for "wii mario kart" on ebay.com, (2) items were in the Video Games > Games > Nintendo Wii section of Ebay, (3) the listing was an auction and not exclusively a "Buy it Now" listing (sellers sometimes offer an optional higher price for a buyer to end bidding and win the auction immediately, which is an *optional* Buy it Now auction), (4) the item listed was the actual game, (5) the item was being sold from the US, (6) the item had at least one bidder, (7) there were no other items included in the auction with the exception of racing wheels, either generic or brand-name being acceptable, and (8) the auction did not end with a Buy It Now option.

mlbBat10

*Major League Baseball Player Hitting Statistics for 2010***Description**

Major League Baseball Player Hitting Statistics for 2010.

Usage

```
data(mlbBat10)
```

Format

A data frame with 1199 observations on the following 19 variables.

`name` Player name

`team` Team abbreviation

`position` Player position

`G` Number of games

`AB` Number of at bats

`R` Number of runs

`H` Number of hits

`2B` Number of doubles

`3B` Number of triples

`HR` Number of home runs

`RBI` Number of runs batted in

`TB` Total bases, computed as $3*HR + 2*3B + 1*2B + H$

BB Number of walks
 SO Number of strikeouts
 SB Number of stolen bases
 CS Number of times caught stealing
 OBP On base percentage
 SLG Slugging percentage (TB / AB)
 AVG Batting average

Source

Data was collected from MLB.com on April 22nd, 2011.

```

myPDF

Custom PDF function

Description

A similar function to pdf and png, except that different defaults are provided, including for the plotting parameters.

Usage

```

myPDF(fileName, width = 5, height = 3,
       mar = c(3.9, 3.9, 1, 1),
       mgp = c(2.8, 0.55, 0),
       las = 1, tcl=-0.3, ...)

myPNG(fileName, width = 600, height = 400,
       mar = c(3.9, 3.9, 1, 1),
       mgp = c(2.8, 0.55, 0),
       las = 1, tcl=-0.3, ...)

```

Arguments

| | |
|----------|--|
| fileName | File name for the image to be output. The name should end in .pdf. |
| width | The width of the image file (inches). Default: 5. |
| height | The height of the image file (inches). Default: 3. |
| mar | Plotting margins. To change, input a numerical vector of length 4. |
| mgp | Margin graphing parameters. To change, input a numerical vector of length 3. The first argument specifies where x and y labels are placed; the second specifies the axis labels are placed; and the third specifies how far to pull the entire axis from the plot. |

las Orientation of axis labels. Input 0 for the default.
 tcl The tick mark length as a proportion of text height. The default is -0.5.
 ... Additional arguments to par.

 ncbirths

North Carolina births

Description

In 2004, the state of North Carolina released to the public a large data set containing information on births recorded in this state. This data set has been of interest to medical researchers who are studying the relation between habits and practices of expectant mothers and the birth of their children. This is a random sample of 1,000 cases from this data set.

Usage

```
data(ncbirths)
```

Format

A data frame with 1000 observations on the following 13 variables.

fage Father's age in years.

mage Mother's age in years.

mature Maturity status of mother.

weeks Length of pregnancy in weeks.
 premie Whether the birth was classified as premature (premie) or full-term.
 visits Number of hospital visits during pregnancy.
 gained Weight gained by mother during pregnancy in pounds.
 weight Weight of the baby at birth in pounds.
 lowbirthweight Whether baby was classified as low birthweight (low) or not (not low).
 gender Gender of the baby, female or male.
 habit Status of the mother as a nonsmoker or a smoker.
 marital Whether mother is married or not married at birth.
 whitemom Whether mom is white or not white.

Examples

```

data(ncbirths)
boxPlot(ncbirths$weight, fact = ncbirths$habit)
boxPlot(ncbirths$visits, fact = ncbirths$whitemom)
boxPlot(ncbirths$gained, fact = ncbirths$mature)

```

normTail

Normal distribution tails

Description

Produce a normal (or t) distribution and shaded tail.

Usage

```

normTail(m = 0, s = 1, L = NULL, U = NULL, M = NULL, df=1000,
curveColor=1, border = 1, col = "#CCCCCC", xlim = NULL,
ylim=NULL, xlab = "", ylab = "", digits = 2, axes = 1,
detail = 999, xLab = c("number", "symbol"), cex.axis = 1,
xAxisIncr=1, ...)

```

Arguments

| | |
|----|---|
| m | Numerical value for the distribution mean. |
| s | Numerical value for the distribution standard deviation. |
| L | Numerical value representing the cutoff for a shaded lower tail. |
| U | Numerical value representing the cutoff for a shaded upper tail. |
| M | Numerical value representing the cutoff for a shaded central region. |
| df | Numerical value describing the degrees of freedom. Default is 1000, which results in a nearly normal distribution. Small values may be useful to emphasize small tails. |

| | |
|------------|--|
| curveColor | The color for the distribution curve. |
| border | The color for the border of the shaded area. |
| col | The color for filling the shaded area. |
| xlim | Limits for the x axis. |
| ylim | Limits for the y axis. |
| xlab | A title for the x axis. |
| ylab | A title for the y axis. |
| digits | The maximum number of digits past the decimal to use in axes values. |
| axes | A numeric value denoting whether to draw both axes (3), only the vertical axes (2), only the horizontal axes (1, the default), or no axes (0). |
| detail | A number describing the number of points to use in drawing the normal curve. Smaller values correspond to a less smooth curve but reduced memory usage in the final file. |
| xLab | If "number", then the axis is drawn at the mean, and every standard deviation out until the third standard deviation. If "symbol", then Greek letters are used for standard deviations from three standard deviations from the mean. |
| cex.axis | Numerical value controlling the size of the axis labels. |
| xAxisIncr | A number describing how often axis labels are placed, scaled by standard deviations. This argument is ignored if xLab="symbol". |
| ... | Additional arguments to plot. |

oscars

Oscar winners, 1929 to 2012

Description

Best actor and actress Oscar winners from 1929 to 2012.

Usage

```
data(oscars)
```

Format

A data frame with 170 observations on the following 10 variables.

`gender` Gender of winner, female or male.

`oscar_no` Denotes which Oscar ceremony.

`oscar_yr` Denotes which Oscar year.

`name` Name of winning actor or actress.

`movie` Name of movie actor or actress got the Oscar for.

`age` Age at which the actor or actress won the Oscar.

`birth_pl` State where the actor or actress was born, country if foreign.

`birth_mo` Birth month of actor or actress.

`birth_d` Birth day of actor or actress.

`birth_y` Birth year of actor or actress.

Details

Although there have been only 84 Oscar ceremonies until 2012, there are 85 male winners and 85 female winners because ties happened on two occasions (1933 for the best actor and 1969 for the best actress).

run10

Cherry Blossom 10 mile run data, 2009

Description

14 variables for all 14,974 10 mile participants in the 2009 Cherry Blossom Run (run10_09) and 9 variables for all 16,924 participants in 2012.

Usage

data(run10)

data(run10_09)

Format

The run10_09 data frame summarizes 14,974 observations on the following 14 variables. The run10 (2012 data) summarizes 16,924 observations on 9 variables, which are featured with an asterisk.

place * Finishing position. Separate positions are provided for each gender.
 time * The total run time. For run10, this is equivalent to netTime.
 netTime The run time from the start line to the finish line.
 pace * The listed pace for each runner.
 age * Age.
 gender * Gender.
 first First name.
 last Last name.
 city Hometown city.
 location * Hometown city. (run10 data only.)
 state * Hometown state. (For run10, this may also list a country.)
 country Hometown country.
 div Running division (age group).
 divPlace * Division place, also broken up by gender.
 divTot * Total number of people in the division (again, also split by gender).

`senateRace10`*Election results for the 2010 U.S. Senate races*

Description

Election results for the 2010 U.S. Senate races

Usage

```
data(senateRace10)
```

Format

A data frame with 38 observations on the following 23 variables.

`id` Unique identifier for the race, which does not overlap with other 2010 races (see [govRace10](#) and [houseRace10](#))

`state` State name

`abbr` State name abbreviation

`name1` Name of the winning candidate

`perc1` Percentage of vote for winning candidate (if more than one candidate)

`party1` Party of winning candidate

`votes1` Number of votes for winning candidate

`name2` Name of candidate with second most votes

`perc2` Percentage of vote for candidate who came in second

`party2` Party of candidate with second most votes

`votes2` Number of votes for candidate who came in second

`name3` Name of candidate with third most votes

`perc3` Percentage of vote for candidate who came in third

`party3` Party of candidate with third most votes

`votes3` Number of votes for candidate who came in third

`name4` Name of candidate with fourth most votes

`perc4` Percentage of vote for candidate who came in fourth

`party4` Party of candidate with fourth most votes

`votes4` Number of votes for candidate who came in fourth

`name5` Name of candidate with fifth most votes

`perc5` Percentage of vote for candidate who came in fifth

`party5` Party of candidate with fifth most votes

`votes5` Number of votes for candidate who came in fifth

smoking

UK Smoking Data

Description

Survey data on smoking habits from the UK. The data set can be used for analyzing the demographic characteristics of smokers and types of tobacco consumed.

Usage

```
data(smoking)
```

Format

A data frame with 1691 observations on the following 12 variables.

gender Gender with levels Female and Male.

age Age.

maritalStatus Marital status with levels Divorced, Married, Separated, Single and Widowed.

highestQualification Highest education level with levels A Levels, Degree, GCSE/CSE, GCSE/O Level, Higher/Sub Degree, No Qualification, ONC/BTEC and Other/Sub Degree

nationality Nationality with levels British, English, Irish, Scottish, Welsh, Other, Refused and Unknown.

ethnicity Ethnicity with levels Asian, Black, Chinese, Mixed, White and Refused Unknown.

grossIncome Gross income with levels Under 2,600, 2,600 to 5,200, 5,200 to 10,400, 10,400 to 15,600, 15,600 to 20,800, 20,800 to 28,600, 28,600 to 36,400, Above 36,400, Refused and Unknown.

region Region with levels London, Midlands & East Anglia, Scotland, South East, South West, The North and Wales

smoke Smoking status with levels No and Yes

amtWeekends Number of cigarettes smoked per day on weekends.

amtWeekdays Number of cigarettes smoked per day on weekdays.

type Type of cigarettes smoked with levels Packets, Hand-Rolled, Both/Mainly Packets and Both/Mainly Hand-Rolled

Source

Examples

```
data(smoking)
str(smoking)
histPlot(smoking$amtWeekends)
histPlot(smoking$amtWeekdays)
table(smoking$smoke, smoking$gender)
mosaicplot(~ smoke + maritalStatus, data = smoking)
barplot(sort(table(smoking$maritalStatus), decreasing = TRUE))
```

textbooks

Textbook data for UCLA Bookstore and Amazon

Description

A random sample was taken of nearly 10% of UCLA courses. The most expensive textbook for each course was identified, and its new price at the UCLA Bookstore and on Amazon.com were recorded.

Usage

```
data(textbooks)
```

Format

A data frame with 73 observations on the following 7 variables.

deptAbbr Course department (abbreviated).

course Course number.

ibsn Book ISBN.

uclaNew New price at the UCLA Bookstore.

amazNew New price on Amazon.com.

more Whether additional books were required for the course (Y means "yes, additional books were required").

diff The UCLA Bookstore price minus the Amazon.com price for each book.

Details

The sample represents only courses where textbooks were listed online through UCLA Bookstore's website. The most expensive textbook was selected based on the UCLA Bookstore price, which may insert bias into the data; for this reason, it may be beneficial to analyze only the data where more is "N".

Source

This data was collected by David M Diez on April 24th.

References

See Section 5.1 of the Open Intro Statistics textbook: <http://www.openintro.org/>

Examples

```
data(textbooks)
#====> an improper analysis <====#
boxPlot(textbooks$uclaNew, xlim=c(0.5,2.5))
boxPlot(textbooks$amazNew, add=2)
axis(1, at=1:2, labels=c('UCLA Bookstore', 'Amazon'))
t.test(textbooks$uclaNew, textbooks$amazNew)

#====> a reasonable analysis <====#
#   the differences are moderately skewed
#   the sample size is sufficiently large to justify t test
histPlot(textbooks$diff)
t.test(textbooks$diff)
```

 tgSpending

Thanksgiving spending, simulated based on Gallup poll.

Description

This entry gives simulated spending data for Americans during Thanksgiving in 2009 based on findings of a Gallup poll.

Usage

```
data(tgSpending)
```

Format

A data frame with 436 observations on the following 1 variable.

spending Amount of spending, in US dollars.

Examples

```
data(tgSpending)
histPlot(tgSpending$spending)
```

| | |
|------|-----------------|
| tips | <i>Tip data</i> |
|------|-----------------|

Description

A simulated data set of tips over a few weeks on a couple days per week. Each tip is associated with a single group, which may include several bills and tables (i.e. groups paid in one lump sum in simulations).

Usage

```
data(tips)
```

Format

A data frame with 95 observations on the following 5 variables.

week Week number.

day Day, either Friday or Tuesday.

nPeop Number of people associated with the group.

bill Total bill for the group.

tip Total tip from the group.

Details

This data set was built using simulations of tables, then bills, then tips based on the bills. Large groups were assumed to only pay the gratuity, which is evident in the data. Tips were set to be plausible round values; they were often (but not always) rounded to dollars, quarters, etc.

Source

Simulated data set.

References

<http://www.openintro.org/>

Examples

```
data(tips)
par(mfrow=c(2,2))
boxPlot(tips$tip, tips$day)
densityPlot(tips$tip, tips$week, key=1:3)
legend('topright', lty=1:3, col=c('black', 'red', 'blue'), legend=1:3)
dotPlot(tips$tip)
densityPlot(tips$tip, tips$day)
legend('topright', col=c('black', 'red'), lty=1:2,
legend=c('Tuesday', 'Friday'))
```

treeDiag

Construct tree diagrams

Description

Construct beautiful tree diagrams

Usage

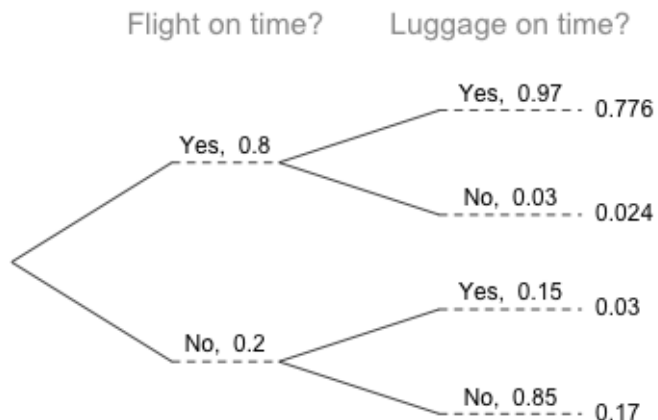

```
treeDiag(main, p1, p2, out1 = c("Yes", "No"), out2 = c("Yes", "No"),
  textwd = 0.15, solwd = 0.2, SBS = c(TRUE, TRUE), showSol = TRUE,
  solSub = NULL, digits = 4, textadj = 0.015, cex.main = 1.3,
  col.main = "#999999", showWork = FALSE)
```

Arguments

| | |
|----------|---|
| main | Character vector with two variable names, descriptions, or questions |
| p1 | Vector of probabilities for the primary branches |
| p2 | List for the secondary branches, where each list item should be a numerical vector of probabilities corresponding to the primary branches of p1 |
| out1 | Character vector of the outcomes corresponding to the primary branches |
| out2 | Character vector of the outcomes corresponding to the secondary branches |
| textwd | The width provided for text with a default of 0.15 |
| solwd | The width provided for the solution with a default of 0.2 |
| SBS | A boolean vector indicating whether to place text and probability side-by-side for the primary and secondary branches |
| showSol | Boolean indicating whether to show the solution in the tree diagram |
| solSub | An optional list of vectors corresponding to p2 to list alternative text or solutions |
| digits | The number of digits to show in the solution |
| textadj | Vertical adjustment of text |
| cex.main | Size of main in the plot |
| col.main | Color of main in the plot |
| showWork | Whether work should be shown for the solutions |

Value

No value is given. A sample plot is given below:

|--------|---------------------------------------|
| unempl | <i>Annual unemployment since 1890</i> |
|--------|---------------------------------------|

Description

A compilation of two data sets that provides an estimate of unemployment from 1890 to 2010.

Usage

```
data(unempl)
```

Format

A data frame with 121 observations on the following 3 variables.

year Year

unemp Unemployment rate, in percent

usData 1 if from the Bureau of Labor Statistics, 0 otherwise

Source

The data are from Wikipedia at the following URL accessed on November 1st, 2010:

http://en.wikipedia.org/wiki/File:US_Unemployment_1890-2009.gif

Below is a direct quotation from Wikipedia describing the sources of the data:

Own work by Peace01234 Complete raw data are on Peace01234. 1930-2009 data are from Bureau of Labor Statistics, Employment status of the civilian noninstitutional population, 1940 to date <ftp://ftp.bls.gov/pub/special.requests/lf/aat1.txt>, retrieved March 6, 2009 and [1] retrieved February 12, 2010. Data prior to 1948 are for persons age 14 and over. Data beginning in 1948 are for persons age 16 and over. See also "Historical Comparability" under the Household Data section of the Explanatory Notes at http://www.bls.gov/cps/eetech_methods.pdf. 1890-1930 data are from Christina Romer (1986). "Spurious Volatility in Historical Unemployment Data", The Journal of Political Economy, 94(1): 1-37. 1930-1940 data are from Robert M. Coen (1973). "Labor Force and Unemployment in the 1920's and 1930's: A Re-Examination Based on Postwar Experience", The Review of Economics and Statistics, 55(1): 46-55. Unemployment data was only surveyed once each decade until 1940 when yearly surveys were begun. The yearly data estimates before 1940 are based on the decade surveys combined with other relevant surveys that were collected during those years. The methods are described in detail by Coen and Romer.
